PowerHandle PH 7.0 Instructions

Designed and Manufactured by Owl Engineering in the USA

The cuff is shipped at it's standard location. You can move it forward or back as you wish. The foam insert is usually not used by most hunters but is supplied if you like them. Be careful since once attached it is hard to remove. The optional KnobGuard is shown and really protects the detector from damage.

Don't be fooled, this is a rugged handle and will help you find more gold and silver since it glides through the water with ease.

The lower shaft has a number of adjustments so to make it the length that fits your style.

Be sure to tape the lower coil wire to the shaft for the maximum benefit.

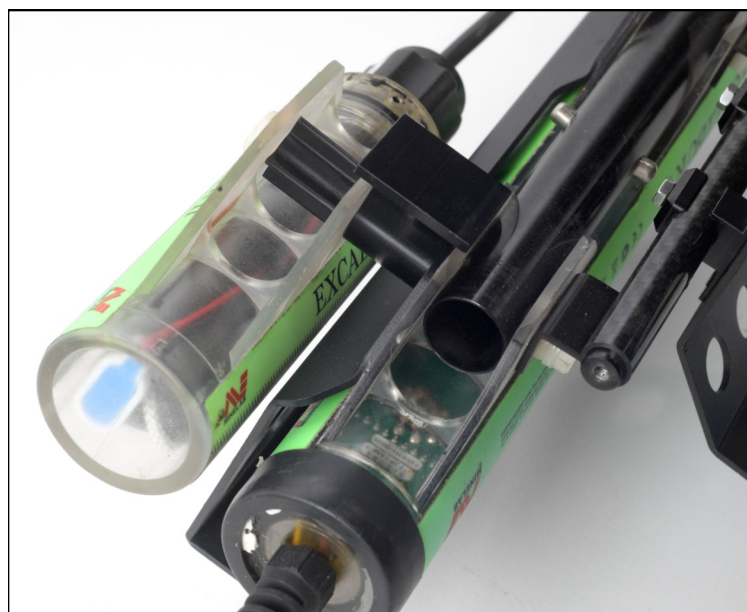

The Battery Off-Set is shown to the right

It keeps the battery away from your hip

Note the supplied spacer within the battery

A 1/4-20 nylon bolt (1 1/2" long) is used at this location. A 1 3/4" bolt is used from the top/right side. It may need a couple of spacer washers (supplied) under it's head to keep it from contacting the bolt from the bottom.
